

ThrushEze™

Hoof Powder

All Bare... 
with natural hoof care
philnik@skymesh.com.au

After dealing with increased rain and wet conditions, over the last few years since the drought, it was found necessary to develop a dry product to aid in the prevention, treatment and control of thrush in the Equine foot. This product is an absorptive powder that is safe, yet effective on thrush. After applying wet treatments such as AVC, tea tree oil and various other treatments, none were effective enough on already wet or waterlogged feet.

Fantastic Results!!!
Contains no carcinogenic chemicals like formalin!

Use inside your hoof boots to assist for treatment and prevention!!

Directions:

For major infections apply once/twice daily to cleaned hoof for the first week, 3-5 times a week until infection subsides. For general use – apply as needed or directed. Wash hands after use.

Testimonial: 'It has been exceptionally wet underfoot in all paddocks this year and impossible to put the horses anywhere where their feet can really dry out for any period of time. This has meant that all the horses have experienced some thrush and it has been particularly bad in the front feet of two of the mares. I had done a lot of searching looking for something to help treat this while trying to keep the horses feet as clean and dry as possible. All of the treatments recommended required soaking of the feet - not something that was very appealing given there were six horses to treat and it didn't seem particularly sensible to try to soak something that was already waterlogged. A friend recommended Nikki's powder to me. Within a few days of using the product once a day, the frogs had dried out considerably- especially the frogs of the two mares that had deep grooves in their frogs. The 'thrushy' smell had also improved a lot. About a week after using the product we had a solid three days of rain which made everything really wet again. I was pleasantly surprised that the horses' feet continued to improve even in the very wet conditions. Now about a month later, I am still using the product. All the horses are continuing to improve and there is nice healthy frog regrowth. A really good feature of this product is how quickly you can get around a lot of horses - really easy to apply, no fuss, no fuss, no smell and best of all no soaking! Thanks Nikki - a really good product.' Regards, Belinda (Bathurst) Aug 2012

Why apply a wet product to already wet feet??? Apply a DRY product instead!!!

Contains the following at specific ratios:

Bentonite Clay

The active mineral composition that makes up this authentic Australian Bentonite Clay has a strong negative ion charge which attaches to (adsorbs) the positively charged particles of pollutants and unhealthy substances. This may be described as a natural magnetic drawing action resulting in deep cleansing.

Diatomaceous Earth (DE)

100% pure and is totally organic and safe. DE is not an earth, but fossilized remains of microscopic shells created by one celled plants called DIATOMS. DE dehydrates insects and pests, and kills by physical action, not chemical, by puncturing the insect's exoskeleton and absorbing the moisture in their bodies.

Copper Sulfate

Copper sulfate is an odorless blue powder or crystal. Commonly used for agricultural purposes as a fungicide to treat fruit and vegetable crops for mildew, blights and other fungus. It functions as a herbicide, fungicide and pesticide. General warning: Health Effects of Copper Sulfate: Copper sulfate is harmful if ingested or if skin is exposed to it in large amounts. It will also cause eye damage. Copper sulfate is not a known carcinogen.

Dolomite

Assists in lowering acidity levels.

Regular cleaning of feet, movement, balanced diet, keeping horse out of manure, urine and excessive mud, and not feeding a diet high in sugar, are all critical factors in managing thrush!!
